TASIBEL

NATURAL FIBRE FLOORING

# the durability of natural fibres

It is very trendy these days to be seen to be green, but TASIBEL has a track record going back to 1923, when it began producing sisal carpeting.

During this time we have amassed a wealth of knowledge about raw material selection and production procedures. We start with the finest sisal fibres, often combining them with other natural products, such as coir, wool, paper or jute.

These natural raw materials are then processed, whilst taking every care to respect the environment, to produce a highly fashionable and durable carpet, for the worlds markets.

# natural raw materials

For the discerning buyer, TASIBEL is acknowledged as the world leader in Natural Fibre Flooring. Tasibel makes full use of renewable materials from all over the world. None of our carpets give off toxic gasses as they do not require any supplementary treatment to enhance their qualities, and all of them are biodegradable.

- pure natural materials
- renewable sources
- produced with respect for the environment
- biodegradable

# produced **with care**

TASIBEL take great care and pride in their product, not just the initial material selection but the whole production process. From spinning and weaving to finishing, everything is processed “in house” and under our direct supervision.

As energy is a valuable commodity, we are constantly striving to upgrade our production methods and reduce our carbon footprint. We are continually upgrading our machinery to become more energy efficient. Where ever possible our own waste is recycled back into the product, if not, then it is disposed of responsibly at a registered site.

- vertical integrated production process
- using only environmentally friendly products
- energy saving measures
- waste management

# our natural flooring has many unique features

Sisal, our base material has many natural qualities. It is highly prized for its strength and durability. It has an ability to regulate the moisture within a room and gives off virtually no static charges.

The natural tannins present in the sisal, help reduce the presence of dust mites, so, as a consequence, the incidence of allergic reactions are lowered.

Together with its sound and heat insulating properties, you are guaranteed a comfortable and relaxing atmosphere.

- **hardwearing**
- **moisture regulating**
- **fewer dust mites**
- **sound-dampening**
- **heat insulating**
- **healthy environment**

# recognised quality

Our customers will be the final judge of our product, but a Swahili phrase “Katani Bora” - “the Best Sisal quality” says it all. Our Sisal is made from the leaves of a sub tropical cactus, which is harvested, grade and dried, in the sunshine of West Africa. Katani Bora not only relates to the fibre itself but also guarantees respect for the environment in which it is grown and towards those who gather the harvest.

For the more technically minded, the GuT certificate shows that Tasibel has produced and monitored the product throughout its manufacturing cycle, adhering to strict environmental standards.
