

New Electrohydraulic servoactuators

Atos digital servoactuators are smart machine's elements providing position closed loop control for any hydraulic axis with optional alternated position and pressure/force controls.

They include low friction servocylinder with integral position/pressure/force transducers and high performance servoproportional valve with on-board digital electronic driver & axis motion controller, thus realizing compact units ready to use after piping to the hydraulic source and wiring to the electronic system.

Atos user friendly PC software allows to set all the performance parameters and the whole motion cycle profile.

Programming interfaces can be selected within: USB, CANopen, PROFIBUS DP, EtherCAT, POWERLINK
