

## Hydraulic valves

The product range of Hunger Maschinen GmbH also includes special valves for hydraulic cylinders in plate or plug-in design for the functions pressure safety, pressure regulation and lowering brake control. Our filling valves in nominal sizes from DN 100 to DN 500 are particularly popular.

In recent years the product range has been considerably extended and deepened. We have constantly expanded and improved our production and quality assurance facilities and opened up new sales markets worldwide.

## Filling valves

Filling valves are used to suck in and fill the main cylinder on presses due to their flow-optimised design. As their mode of operation is similar to that of a non-return valve, they can be used to shut off pressurised cylinders free of leakage oil.

The Hunger filling valve is available in two designs - as a tank installation and as a valve for pipeline installation.
