

R-DRY SERIES

HEAT REGENERATED ADSORPTION DRYERS

operating pressure	4 to 11 bar
operating temp.range	1,5 to 50 °C
pressure dew points	-40 °C
flow rate	390 to 20.200 Nm ³ /h

APPLICATIONS

- compressed air systems

DESCRIPTION

R-DRY 400 - 20000 adsorption dryers are designed for continuous separation of water vapour from compressed air thus reducing dew point. Operation of dryer requires two columns operated alternately. Adsorption takes place under pressure in first column while second column regenerates with a heated ambient air or purge.

A dryer consists of two columns, filled with desiccant beads, blower, heater, controller with LCD display, valves, manometers, and support construction. Proven robust design enables efficient and reliable operation, fast installation and simple maintenance.

DRYER TYPE	REGENERATION	COOLING
BP	blower, ambient air	purge air
BVA	blower, ambient air	blower, vacuum air

Protection class	IP 54
Filter (inlet)	super fine - 0,01 µm
Filter (outlet)	dust filter; 1 µm
Column insulation	optional
