The Product

Peakboard is an all-in-one solution consisting of software and hardware for the aggregation of data from various sources and for visualizing them in real time. A central server is not required as each Peakboard visualizes the data independently. The Peakboard accesses a data source directly via Wi-fi or LAN, aggregates the data for visualization and transmits it via an HDMI cable to the desired (large) screen.

The focus is to combine the simplicity and flexibility of a digital signage application with the complexity of business process data and metrics. As an innovative visualization technology for the professional and industrial sector, Peakboard is one of the most powerful industry 4.0 solutions on the market.

The Company

Peakboard was founded in 2015 and is a 100% subsidiary of Theobald Software GmbH. With more than 2,500 customers and 15 years of experience in the field of SAP interface technology, we have more know-how in the visualization of business processes than any other provider on the market. It goes without saying that Peakboard is SAP-certified.
