

The primary characteristic of the AF series cabinets is the monoblock frame: the bottom, roof and pre-bored electro welded sides in press bent sheet steel. Access to the cabinet is provided through the front and rear, where a door and rear panel are installed, or both a front and rear door. Along the entire perimeter of the inside, there is the usual boring with the step for attachment of components. The door and rear panels are the same ones used in the AX and AZ series. On the bottom of the monoblock there is an opening

for the passage of cables, with a panel for closure. In addition to the basic configuration, it is also possible to order the following configurations:

- AFB** – Blind external door;
- AFV** – Transparent external door and blind internal door;
- AFD** – Transparent external door and frame with modular internal panels.
