

Streamsheets

Spreadsheets that talk to machines, apps and services

Use your Spreadsheet skills to control data streams and build microservices

A process or even a whole business is a stream of events... ... and reacting to these events

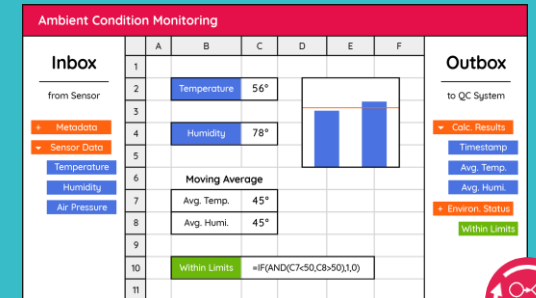

* Managed by Stream-Processing Platforms like Apache Kafka, Amazon Kinesis, Azure Event Hub, Google Pub/Sub, OPC UA Pub/Sub, MQTT, AMQP, ...

But until now you needed to be a programmer
to orchestrate and control Data Streams
and create Apps or Services

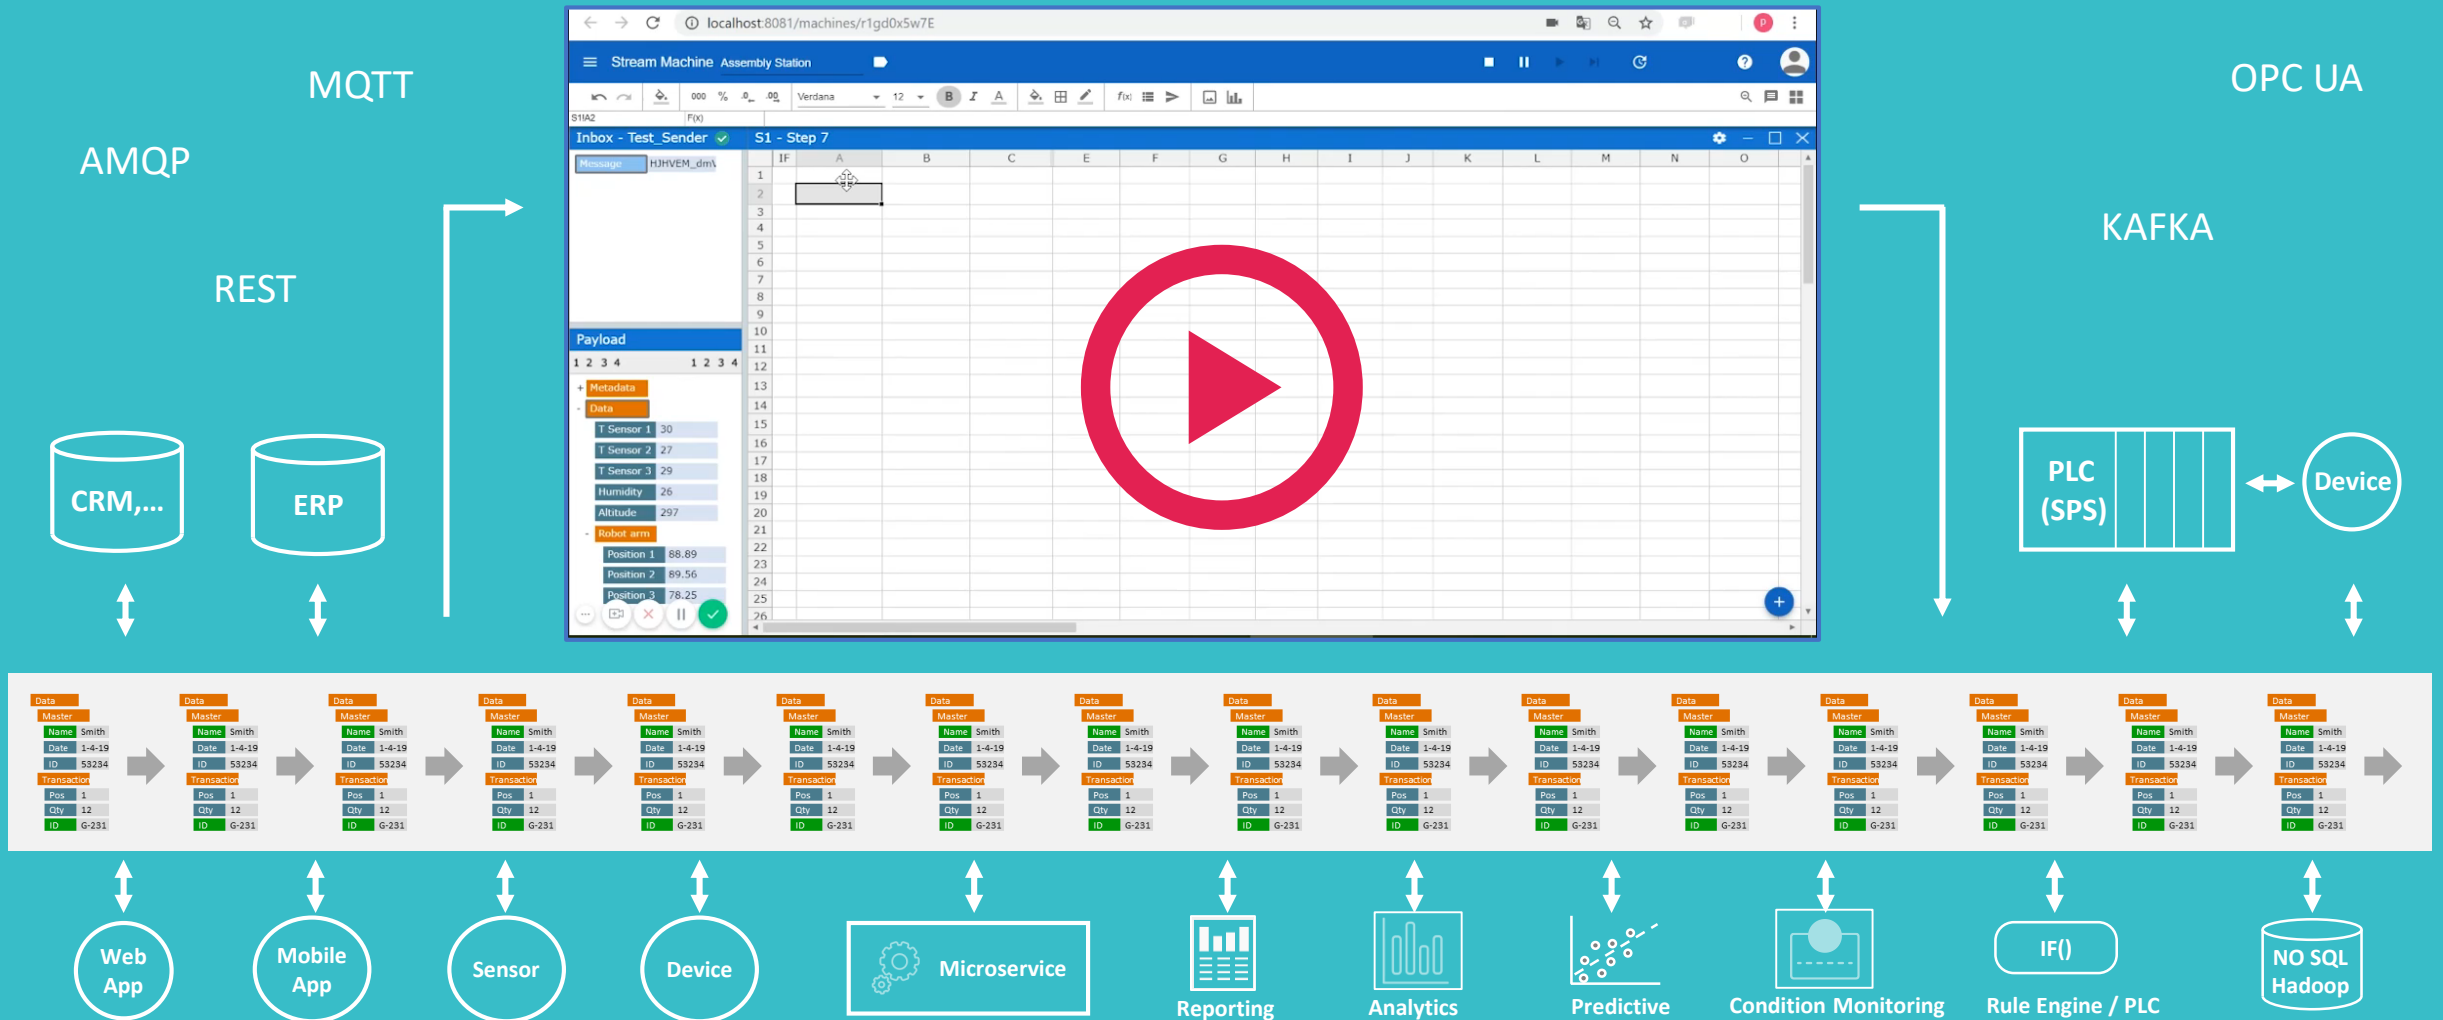

```
var client = EventHubClient.fromConnectionString();  
.then(client.getPartitionIds.bind(client))  
.then(function (partitionIds) {  
  return partitionIds.map(function (partitionId) {  
    return client.createReceiver('$Default',  
      partitionId, {  
        startAfterTime:  
      });  
  });  
})  
.catch(printError);
```

With Cedalo's new Streamsheets technology
you use your spreadsheet skills
to build Stream processors and IoT Apps
by simply linking cells and entering formulas.

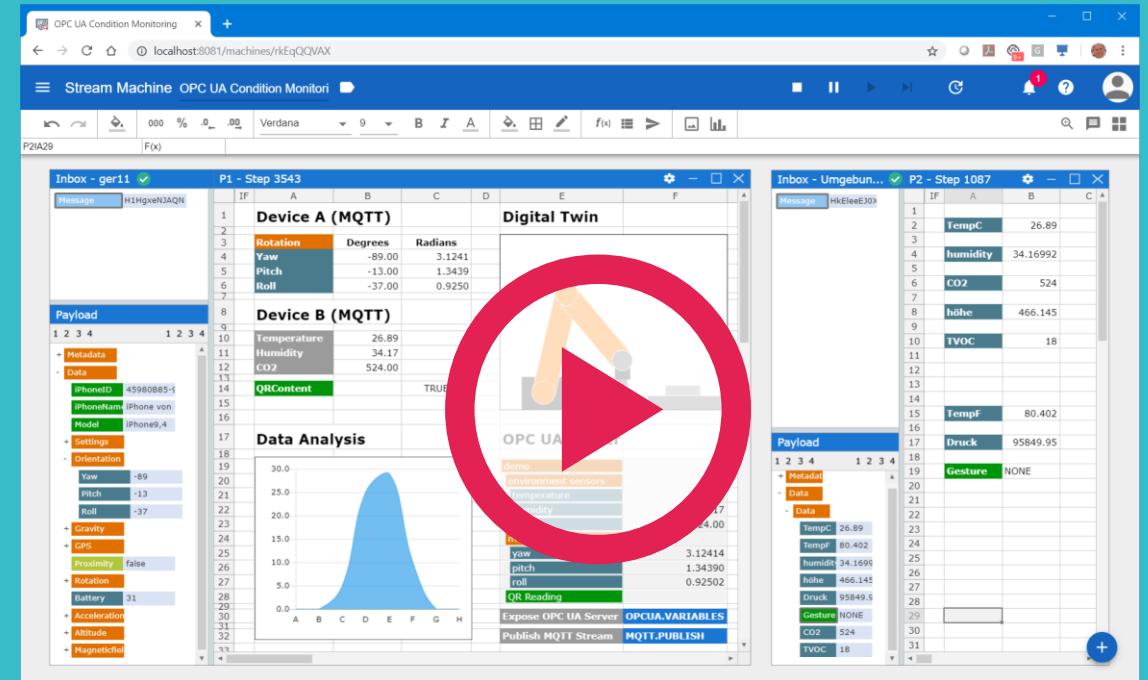

Streamsheets = Server-Based Real-Time Spreadsheet for Stream Processing

Typical Use Cases for Streamsheets in IoT and Industry 4.0

- **Stream-Analytics** and Predictive Statistics
- **Condition Monitoring** (Real-Time Dashboards, SCADA)
- **Rule Engine** / Conditional Alert & Actions / Soft PLC
- **On the edge Pre-Processing** and **Data Pooling**
- **Simulation** of IoT Data Sources and IoT Devices
- **Protocol and Semantic Mappings** (e.g. MQTT \leftrightarrow OPC UA)
- **OPC UA Cloud Proxy** (Tunneling via MQTT, REST, AMQP)
- **Pre-Processing** for Blockchains and **AI-Systems**
- **Many more** use cases...

cedalo

Highlights & Advantages

- **Time savings:** No lengthy briefings → instant start and deployment
- **Cost savings:** Process owner does not need to hire a programmer
- **Little training required:** Accepted and familiar user interface
- **Interactive development:** Instant discovery of errors and logical flaws
- **One united team:** OT and IT integrate seamlessly and digitalize together

Streamsheets

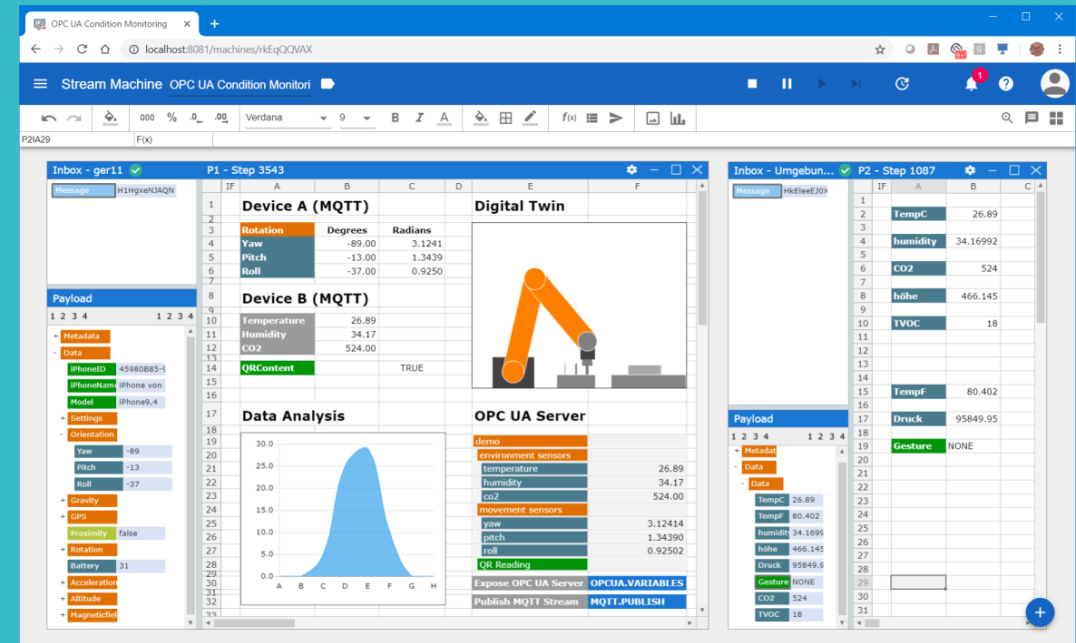

Spreadsheets that talk to machines, apps and services

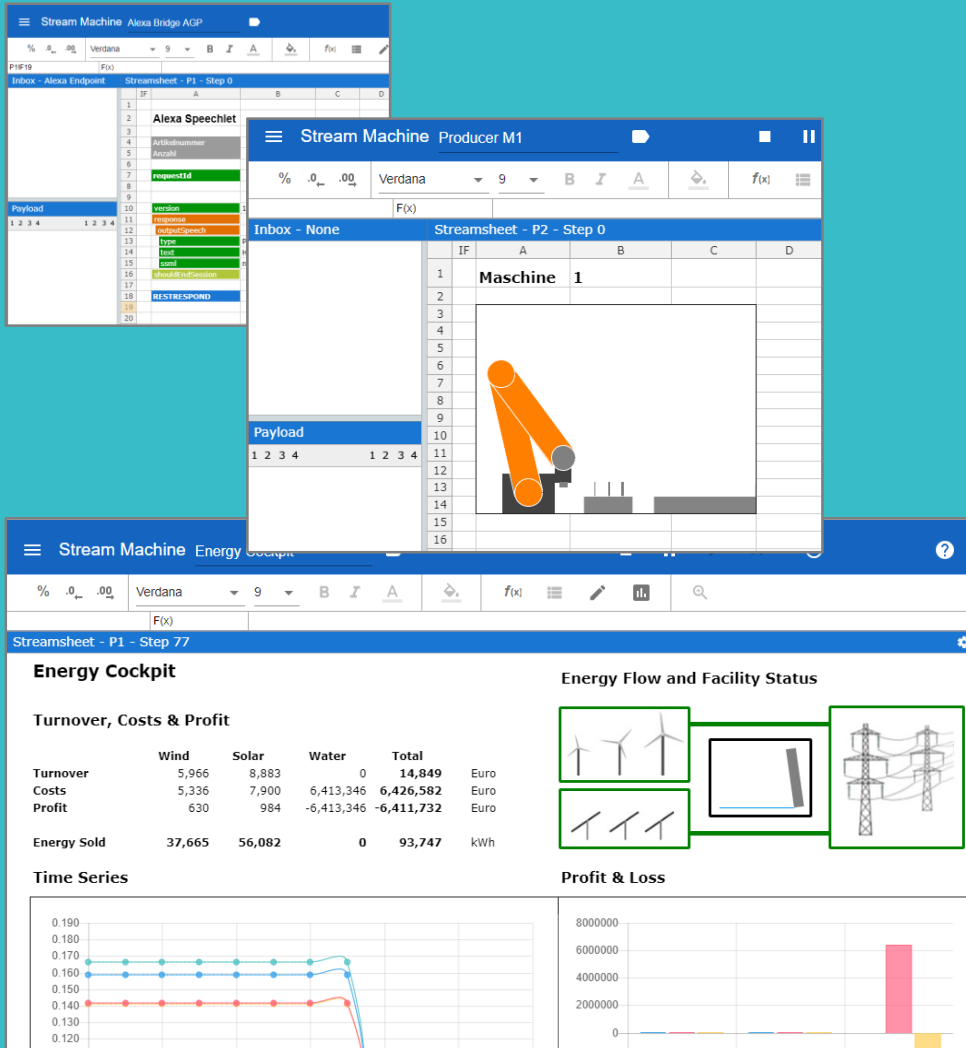

Philipp Struß – Co-Founder
philipp.struss@cedalo.com

Important Streamsheet capabilities (1)

- **Drag-&Drop** between cells and JSON
- Several recalculation modes such as:
Event driven and **cycle driven** (up to ~ 4 ms)
- Streamsheet cells **maintain state** by design
- Combine and synchronize data streams
- See what your logic is doing **while creating it**
 - Build formula by formula
 - No compiling necessary
 - Not selective insight but full overview

Important Streamsheet capabilities (2)

- Build templates and customize them individually
- Custom charts and data-dynamic drawings
- Available on-premise and cloud-based
- Support for all modern APIs and IoT protocols via simple Spreadsheet functions:
 - OPC UA Server and OPC UA client
 - MQTT Subscriber, Kafka consumer, REST client
 - MQTT Publisher, Kafka Producer, REST Server
 - Mails and Messaging (SMTP, POP3, Slack)
