

Process Portals for Every Taste

SemTalk Services enable portal users readers to interact with a process model through their browser without requiring a license for the modeling tool itself. Functions are created via Web Parts in Microsoft SharePoint in combination with the Visio Web Access or in frames Targeted access to the knowledge contained in the process model. Within Microsoft SharePoint, you can configure very flexible and lightweight portals, which can be a great feature for you or in combination with other SharePoint Web Parts.

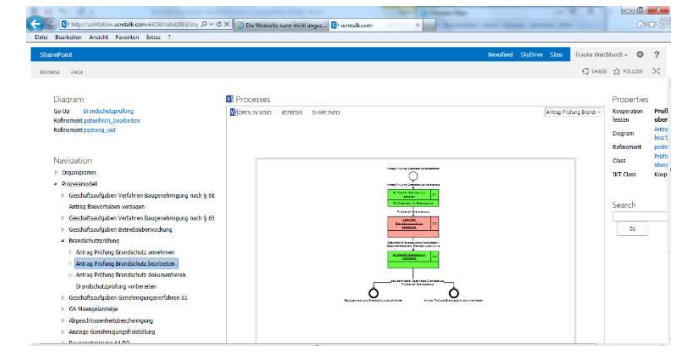

The first stage of process model publishing is usually to provide the process images. Frequently images alone are not useful because targeted navigation to the desired location is not available or because it is not possible to evaluate the data stored in the process models.

SemTalk® Services Scenarios

Processes are often created as hierarchical structures by branching from one diagram to several others. Finding the relevant process takes place via a tree structure. Ease of access is accelerated since it is no longer necessary to open all the diagrams of the hierarchy in order to reach the target.

Often the search for relevant processes begins with the information that a particular role is involved, or a particular document is used. Introducing a tree structure of the modeling elements makes it possible to quickly locate the corresponding modeling elements. From there it is easy to get to the relevant process.

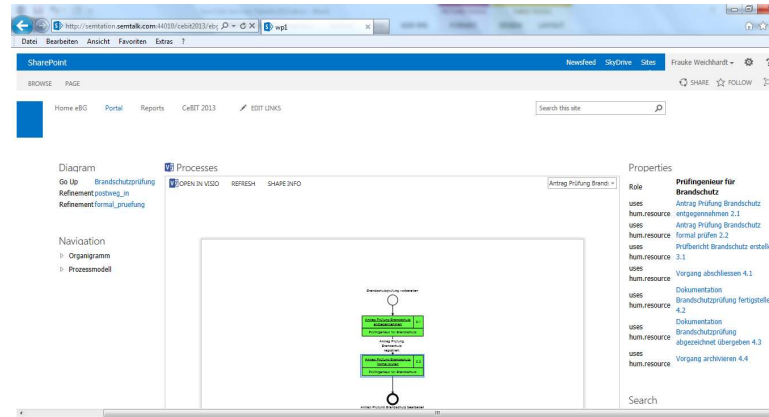

Semtion GmbH

Process Portal as an Integrated Intranet Element

Portals not only serve to navigate within your process world, they also allow process models to be linked to data from other contexts. For example, the assignment of the process-relevant workflow can be visualized or the output of a comment can form as an entry in a SharePoint action list.

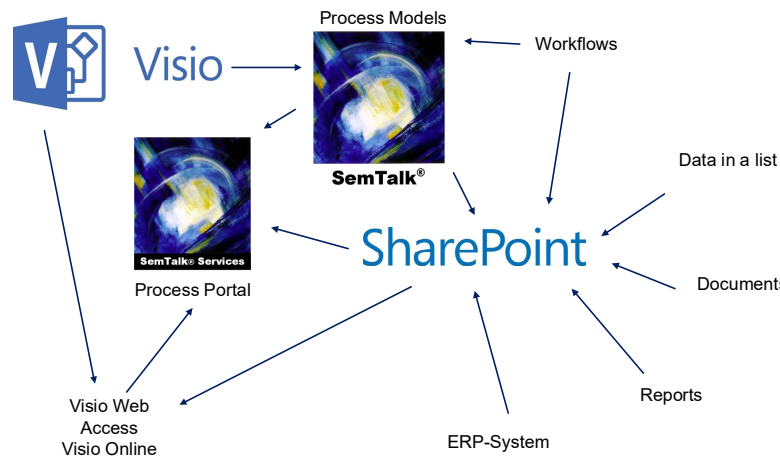

Process modeling is an indispensable tool for targeted organizational change - if done well.

It is not only about looking at a process diagrams, it is also about the provision of cross-process data. Reports about stored process models provide valuable information for the readers of the process. Data visualization components make it easy to set up process cockpits.

The following scenarios are covered among others:

- Process monitoring
- Quality management
- Risk management
- Knowledge management
-

Elements of SemTalk Knowledge Architecture

Your Opportunity

Design your process portal according to your needs based on proven technologies. The SemTalk services complement the modeling platform SemTalk, which provides you with a powerful modeling tool based on Microsoft Visio.
