

HEBOR Setting Gauge, Model H 50

This remarkable precision instrument is a suitable accessory for moulders and other machines where exact setting of the cutting head is required.

A large scale with accuracy of 0,2 mm and adjustment screw provide for accurate setting which can be done in seconds; the setting value is read directly on the scale. Periodical checking of the setting value can be also done easily and quickly anytime. The setting is carried out when the machine is switched off and no trial turns are necessary. The possibility of accidents due to setting during trial runs is thus avoided.

The HEBOR Setting Gauge H 50 is versatile, precise, and it enables a safe setting. It sets a new standard for safety regulations and it is therefore recommended by the German Professional Association of Woodworking Industry.
