

ONE TIME USE PCD cutters

In order to meet our clients' expectations and at the same time, help to resolve the difficulties related to the PCD tools re-grinding, FABA S.A. decided to introduce into the market our new one time use PCD shank cutter - TJD-08 type.

The one time use PCD shank cutter belongs to the group of TJD cutters and is almost the same cutter as TJD-07. The only difference between them is that the TJD-07 is more economical, as it can be re-ground 2-3 times, while TJD-08, as mentioned above, is a cutter for one time use only and it is not to be re-ground.

TJD-08 shank cutters are with axial angles for use on CNC machining centers.

They are used for making keys, rungs and for shapes formatting.

Thanks to their construction these tools assure:

- noiseless and stable work
- high quality of machined surface
- greater durability

The mentioned cutters are appropriate for machining following materials:

- chipboards
- laminates;
- MDF & HDF
- CORIAN.
- hard exotic wood
