

Special Precision-TWIN-HEAD-Wet-Knife-Grinding Machine GS150/200

Precision-TWIN-HEAD Grinding/Lapping Heads (detail view)

These automatic precision wet knife grinding machines from MARUNAKA are excellently suitable for rough and finish (lapping) grinding of knives from lengthwise slicers among others.

The max. grinding lengths are 1,500 resp. 2,000 mm. The clamping width of the magnetic table is max. 200 mm.

Due to the combination of rough grinding and lapping of the knife an incredible precision would be achieved during slicing of veneer or lamellae (slats). Especially due to the lapping process the live time of the knife increases significantly.

Veneer knives which are only rough grinded have definitely reduced live time and the surface quality whether veneer or lamellae (slats) is poor.

Furthermore this grinder is also suitable for re-grinding of the nose bar from our lengthwise slicer.
