

RSV low pressure purge air cleaner

- for continuous operation
- suitable for vacuum operation
- explosion pressure shock resistance tested
- expandable modular system, galvanised
- material-preserving cleaning
- optional compressed air pulse cleaning
- performance range up to 370.000 m³/h
- wide range of types in practical graduations

Cleaning

The flushing trolley drives back and forth over the hose openings in the clean air chamber, either continuously or pressure-controlled. In the direction of movement the first filter hose row is neutralised, while the second row is flushed from the clean air side. The third row is likewise neutralised. This results in a draught delay, which is necessary in order to allow the dislodged dust to fall into the discharge.
